COMPUTING OF GROUP-SUBGROUPOIDS OF MODULAR GROUP-GROUPOID $\mathbf{Z}_n(a,b)$

MARIAN DEGERATU[1] AND MIHAI IVAN[2]

Abstract. A group-groupoid is an algebraic structure which combines the concepts of group and groupoid such that these are compatible. We give an algorithm for finding of group-subgroupoids of a finite group-groupoid. For applying this algorithm, the program *BGroidAP*8 is used.
